"Regulation of PDK4 expression in a hibernating mammal.";
Submitted (JUN-2001) to the EXBL/GonBank/DBUJ databases.
-!- FUNCTION: INSULIN DECREASES BLOOD GLUCOSE CONCENTRATION. IT
INCREASES CELL PERMEABILITY TO MONOSACCHARIDES, AMINO ACIDS AND FATTY ACIDS. IT ACCELERATES GLYCOLYSIS, THE PENTOSE PHOSPHAIE
CYCLE, AND GLYCOGEN SYNTHESIS IN LIVER.
-!- SJBGNIT: HETTERODIMER OF A B CHAIN AND AN A CHAIN LINKED BY TWO
DISGLEDE BONDS.

"Structure of monomeric porcine DesB1-B2 despentapoptide (B26-B3C)
insulin at 1.65-a resolution.";
Acta Crystallogr. D 53:507-512(1997).
-!-FUNCTION: INSULIN DECREASES BLOOD GLUCOSE CONCENTRATION. IT
INCREASES CELL PERMEABILITY TO MONOSACCHARIDES, AMING ACIDS AND
FATTY ACIDS. IT ACCELERATES GLYCOLYSIS, THE PENTOSE PHOSPHATE
CYCLE, AND GLYCOSEN SYNTHESIS IN LIVER.
-!-SUBDINT: HETEROLIMER OF A B CHAIN AND AN A CHAIN LINKED BY TWO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           NOTE-Issue 9 of April 2001;

New chimeric proteins containing human growth hormone fragment, used WELL 1999-610839/52.

~

```
This sequence represents a chimeric protein, which contains an N-terminal tragment of human growth hormone (bHB) of the sequence growed in AAV42856, and cleavable peptide linear (AAV42859), and sharin insulfs procursor compising itsulfs the chimeric protein acts as an intramolecular chaperone (IMC) for the chimeric protein acts as an intramolecular chaperone (IMC) for the thisulin procursor combined in to fold correctly. The cleavable peptide incher has a C-terminal Arg residue which enables the high portion of the chimeric protein to be removed after folding has taken place. Production of recombinant human insulin with an hose protein binderic protein can provide human insulin with or negative protein binderic protein can provide human insulin with correctly linked exercise binders with fewer cheesary procedural stops, and hose resulting in a higher yield of human insulin with sequences from intracellular detachatically processed for intracellular detachatically processed for intracellular detachatically processed for intracellular detachatically processed for the fision protein and decrease the interrolember in the solubility of the fision protein and decrease the interrolember in the

                                                                                                                                                                                                                                                                                                                                                                                     interactions aroup the fusion proteins, thus allowing folding of the fused insuling precursor at commercially useful high concentrations. The procedural steps of cyanogen broaded elevance, askidative sulphinolysis and related purification steps can thus be eliminated, along with the use of high concentrations of mercaptan or the use of hydrophobic absorbent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             61 TESNREETQOKSNLELLR (SELLIOSWLEPVQLGTGPR?VNGHLGGSHLVEALYLVGGER 120

This sequence represents a chimeric protein, AGH-mini-proinsuine.

This chimeric protein contains an N-terminal fragment of buman growth horzone (AGH) of the sequence given in AAV42855, a cleavable peptide linker (AAV42857), and a cumman insulin precursor comprising insulin as an intramolecular chapterone (IMC) for the insulin precursor, and intramolecular chapterone (IMC) for the insulin precursor, could correctly. The deavable peptide linker has a clearing it to fold correctly. The cleavable peptide linker has a clearing it to fold correctly. The cleavable peptide linker has a clearing it to fold correctly. The cleavable peptide linker has a clearing that for earnowing the high portion of the cleavable between procedural such National Carpetine of the recombinant human insulin with correctly linked cysteine bridges with lewer necessary procedural steps, and hence resulting in a higher yield to human insulin. The IMC sequences not only protect insulin sequences for human insulin. The IMC sequences not only protect insulin sequences for human insulin precisor, and hence resulting a significant of the figure of the flaced issulin precisor, insulin each promote the figure of the flaced issulin precisor, insulin each promote the figure folding of the flaced issulin precisor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          the fusion protein and decrease the intermolecular interactions among the fusion proteins, thus allowing folding of the fused insulin precursor at commercially useful high concentrations. The procedural steps of cyanogen bromide cleavage, oxidative sulphitolysis and related purification steps can thus be eliminated, along with the use of high concentrations of mercaptan or the use of hydrophobic absorbent resins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               61 TPSNREETQQKSNLELLRISLLLIQSWLEPVQLGTGPRFVNQHLCGSHLVEALYLVCGER 120

                                                                                                                                                                                  (hGH) which is a component of a chimeric protein (AN42861) which also contains a human insulin precursor (AA42869). The ESH portion of the chimeric protein acts as an intramolecular chaperoue (1MC) for the insulin precursor, enabling it to fold correctly. A cleavable peptide linked with a C-terminal Ang residue (AN42867) enables the huis pertion of the chimeric protein to be removed after folding has taken place. Production of recombinant human insulin with an huis-precisation of recombinant human insulin with correctly linked cysteins better protein can provide tuman insulin with correctly linked cysteins better with fewer necessary procedural steps, and hence resulting in a higher yield of human insulin with correctly linked cysteins better with fewer necessary procedural steps, and hence resulting in a higher yield of human insulin and december only protect insulin a sequences from intracellular degladation by a microcramism host, but also protein the folding of the fosed insulin precursor, insuline the solubility of the fusion protein and docrease the interminents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           interactions among the fusion proteins. thus allowing relating of the fused institut precursor at commercially useful high connections. The procedural steps of eyanoges tromide cleavage, oxidative supplitions and related purification steps can thins be eliminated, along with the use of high concentrations of mercaptam or the use of hydrophobic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             1 MEPTIPLSRLFONAMIRAGRINGLAFOTYQEFERNIFKEGKYSFLONFQISLSTSFSIF

This invention describes novel human anti-anglogenic peptides derived from 10 to 150 consecutive amino acids selected from the N-terminal end of from 10 to 150 consecutive amino acids selected from the N-terminal end of human place of human growth hormone variant (hGH-V), or human prolactin. Such peptides (i) inhibit of hormone variant (hGH-V), or human prolactin. Such peptides (i) inhibit complements in chick thorioaliantoid memorane and (ii) binds to at magingenessis in chick thorioaliantoid memorane and (iii) binds to at magingenessis and chick thorioaliantoid memorane and (iii) binds to at magingenessis and product or high-V. The invention also describes a method for Garnersing a probable abnormality of placental vascularisation during programmy. The peptides can be used for treating an anglogenic disease in a subject, for inhibiting tummour formation or growth in a patient or for modulating vascularisation of a patient.'S placenta. In particular, the peptides can be used for treating or treating as rheumatoid arthritis, athereselerotic plaques, corneal graft neovascularisation, arthritis, andromedial proliferative retinopathy such as theose occurring arthritis, athereselerotic plaques, corneal graft neovascularisation, arthritis, inappropriate vascularisation in wound healing such as hypertrophic sears or keloid sears, neovascular glaucoma, corlar, through such as disorders such as follicular and luteal cysts and choicane, trachoma, vascular adhesions, chronic variant the controcarcinoma, trachoma, vascular adhesions, chronic variant the encoding the peptides can be used as contraceptive agents. DNA cancer in meaning tragments of base of a pacental development associated the absonciated in assays for impairment of vascular development associated by whith pre-celampsia, intranterine growth retardation, and placental
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           1 MFPTIPLSRLFDNAMLRAHRLHQLAFDTYQEFEEAYIPKEQKYSFLQNPQTSLSFSESIP 60

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The inversion relates to literativing an inknown active densary in the inversion relates to literativing an inknown amino acid sequence in a parent polypeptide or 4 human growth hormone (hGH) which has been cloned and has a pre-identified biological active domain interacts with a target, when the parcit polypeptide is in its native folded form and the interaction is comparant to polypeptide is in its native folded form and the interaction is comparant to a sequence or polypeptide structure in the region of known amino acid sequence or polypeptide structure in a region of known amino acid sequence or polypeptide structure in a region of known amino acid sequence or polypeptide structure in a region of known amino acid sequence or polypeptide contains a region of known amino acid sequence or polypeptide of known amino acid sequence of an analogue of containing at least 15% homology with BGH alpha-carbon coordinates within about 2:55 anguence, where any interaction of the coordinates within about 2:55 anguence, where any interaction of the analogue into DNA encoding the full length hGH, and expressing a sequence consolution of the interaction of the consolution of polypeptide into DNA encoding the full length hGH, and expressing a sequence consolution and polypeptides as an indication of the location of the unknown active domain in hGH. The method is useful for determining the sequences of the relationship between structure and function of the location of the relationship between structure and function of the location of the relationship between structure and function of the location of the relationship between structure and function of the location of match the second assigned to describe and any second sequences. The present sequence is that of hamman growth hormony of the location of the relationship between structure and function of the location of the relationship between structure and function of the location of the relationship between structure and function of the location of the location of the relationsh
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    invention relates to identifying an unknown active domain in a region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   PPTIPLSRIFONAMIRAHECHQLAFDTYQEFERAY (PREGRYSFLONEGTSLSFSESIF) = 1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  identifying active domains within cloned polypeptides of known amino acid sequence by substituting analog segments into the parent polypeptide is useful to determine the relationship between structure
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     18; days

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      09
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1 MFPTIPLSRIFONAMIRAHRIHQLAFDTYQEFEEAYIPKEGKYSFUONPQTSLSFSESIP
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention consists of a vector contg. a fusion protein which is formed by ligating, downstream of a promoter, hGH or a deriv. (prof. formed by subtstn. or Met.14 with Leu) and a foreign protein. Stability of the vector in the nost is greatly increased so the protein yield is higher.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Recombinant vector contq. fusion protein – consisting of human growth hormone or deriv. ligated to foreign protein, for stability
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     16;

This invention describes nevel human anti-angumente peptides nectived from 10 to 150 consecutive amino acids selected from the Negarinal and of human placental lactogen (hE), human trowth hormone (hE), and the bormone variant (hEH-V), or human prolacing such peptides (i) inhibit capillary endethelial cell proliferation and organisation (ii) linhibit anglogenesis in chief cell proliferation and organisation (ii) linhibit anglogenesis in chief cell proliferation and organisation (ii) linhibit anglogenesis in chief cell proliferation and organisation (iii) linhibit and hois, hE, prelation or mSH-V. The invention also discribes a method for diagnosing a probable abnormality of placental vascularisation diring preparacy. The peptides can be used for treation or drowth in a patient or commodilating vascularisation of a pricent's placental in particular, the peptides can be used for treation or drowth in a patient or commodilating vascularisation of a patient's placental in particular, the peptides can be used for preventing or treating each as rheumicid anglofibroma, afteriovenous malformation, arthritic such as rheumicid such as hypertrophic scars or keloid scars, neovascular alaucera, ocular tumour, uveitis, non-union fractures, Osler-Weber syndrome, psoriasis, pyogenic glaucoma, retrolental fibroplasia, scheroderma, solid timnours, Raposi's sarcoma, trachoma, vascular adhesions, chronic varicose micras, leukaemia, and reproductive disorders such as follocular and inteal organ and choriocarcinoma. They can also be used as contraceptive access. DNA abnormal levels of N-terminal fragments of hGH, hGH-V, prolactin of hBL can be used in assays for impairment of vascular development usbodied with pre-columpsia, intrauterine growth retardation, and placental arthritis, atherosclerotic plaques, corneal graft necessoriarisation, delayed wound healing, proliferative retinopathy such as diametic retinopathy, macular degeneration, granulations such as those occurring in hacmophilic joints, inappropriate vascularisation in wound healing

Beta-NGF can be used to control geriatric dementia and other nervous disorders, and can be released from the folsion protein by incubation with thrombin (see AAN90577-8, AAP91034, AAP91299).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  1 MEPTIPLSHIFDNAMIRAHRLHQIAFDTYQEFEEAYIPKEQKYSFLQNPQTSLSFSESTP 60

It is purified by contacting a gel maying a cation exchange gp. with the fusion protein, in the presence of urea. The purified protein is useful in a medicament is in realing disorders of the nervous system, eq dementia. (Updated on 25-WAR-2003 to correct PP field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 N-terminal end (1st region), a 3 amino acid sequence representina thrombin recognition site, and buran beta nerve drowth factor (beta-NUF) at the C-terminal. Beta-NUF can be used to control geriatize demotia and other nervous disorders, and can be released from the lusion protein by incubation with thrombin (see AAN96577-9, AAP91034.

(GE) activity and comprise at least one non-polypeptide group covalently attached to a GE polypeptide. The amino acid sequence of the conjugates differs from that of wild type human GH in at least one introduced and at least one removed amino acid residue comprising an attachment group for the first non-polypeptide group. The conjugate or pharmaceutical medicament for treating a disease or for manufacturing a medicament for treating a disease or for manufacturing a medicament for treating a disease, e.g. Turner's syndrome. GH deficiency in adults (i.e. GHDA), achonicroplasia, chronic renal insufficiency of failure (including renal failure in children), acquired immune deficiency syndrome (AIDS) was ting, cachexia in AIDS patients, or cachexia associated with other diseases. The conjugates are useful for treating a variety of disorders caused by growth hormone inadequacy. The present

The invention relates to identifying an extrost active demain in a region of known amino acid sequence in a parent polymentage of the active has been cloned and has a pre-identified thost lives of carivity, where the active cloned and has a pre-identified thost lives the active domain interacts with a turge when the partial polymentage is in its native-folded form and the interaction is responsible for the holospical activity exprision; of comparing the amino acid sequence of polymentage of high with the artino acid sequence of high with the artino acid sequence of an analogue production of known amino acid sequence of an analogue operation of known amino acid sequence of an analogue operation of known amino acid sequence of an analogue operation of known amino acid sequence or polymentage of an analogue action of known amino acid sequence or polymentage of the acid of the acid of a consideration of the acid of a consideration of the acid of a consideration of the acid of acid of a consideration of the acid of acid of a consideration of the consideration of the acid of a consideration of the cons
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    (e) comparing the difference between activity of the first and second segment-substituted polypeptides as an indication of the location of the unknown active domain in AGH. The method is useful for determining
                                                                                                        acid sequence by substituting analog sequents into the parent, polypeptide is useful to determine the relationship between structure
                                                                        identifying active domains within closed polypoptides of known artho-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Note: The present sequence is not shown in the specification but was created by the indexer using the mature NGH sequence and information
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                the relationship between structure and function of known polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        sequences. The present sequence is that of human growth hormobic mutant substituted with resilues from an holf analogue (prolacin) placental lactogen or porcine growth hormone).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            and (c) with a second analogous polypeptide segment, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          3; Mismatches

control of the sequence in a parent, polypeptide e.g. thuman growth cormone (hGH) which has been cloned and has a pre-identified biological activity, where the active domain interacts with a trarget when the parent polypeptide is in its native-folded form and the interaction is responsible for the biological activity comprising: (a) comparing the amino acid sequence of polypeptide structure in the region of known amino acid sequence of polypeptide structure in the region of known amino acid sequence of polypeptide structure in the region of known amino acid sequence or polypeptide structure in the region of known amino acid sequence or polypeptide (e.g. prolactin, placental lactogen or porcine growth normone) which has at least 15% homology with hGH alpha-carbon coordinates for about 60% of the analogue sequence, where any interaction of the analogue with the target is different from tranget interaction of the analogue into DNA encoding the full length hGH, and expressing a malogue into DNA encoding the full length hGH, and expressing from the conjugation of the different contaction; (b) substituted polypeptide; (c) contacting the sequent; and second analogues polypeptide sequent; and second analogues polypeptide.

segment-substituted polypoptides as an indication of the location of the unknown active domain in hGH. The method is useful for determining the relationship between structure and function of known polypoptide sequences. The present sequence is that of human growth hormone mutant substituted at functionally important residues and used in

The present sequence is not shown in the specification but was d by the indexes using the mature HGH sequence and information

contained in the specification.

a

```
The sequence encoding this protess can be tused with DNA encoding Breell differentiation factor (IL-6) and ligated into an expression vector to prodm. of a fusion protein. See also AAR05311.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Preph. of human Breell differentiation factor - from specified DNA sequence segment, by recombinant DNA technique, gives protein of specified asino acid sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Oucry Match 58.0%, Score 462, 18 11, Lougth 144: Best Local Similarity 97.8%; Pred.
